	Urgent	**Not urgent**
Important	**<u>Do - (Your MVP):</u>** ● Process local LLM commands ○ Organize command ○ Approve/Reject command ● Prompt user to upload bookmark file when organize command is called ● Create in-between planning prompt for the LLM to brainstorm and evaluate a potential taxonomy ● Loop through bookmarks and assign category ● Create export file in format of bookmark file for user to download	**<u>Schedule - (For V2.0+):</u>** ● Pull real-time bookmarks without user needing to upload bookmark file ● Automatically replace bookmarks once approved without needing export ● Experiment with shorter/more concise file formats and prompts to save tokens ● Categorize bookmarks into an “Uncertainty” category to ask the user follow-up questions ● Incorporate user responses from rejected plans to guide local LLM when drafting a new plan
Not Important	**<u>Delegate - (Use a library):</u>** ● Utilize sentence_transformers library to evaluate semantic similarity between LLM taxonomy and human-specified taxonomy on a test data set ● Connect local LLM to Python using ollama/openai libraries ● Use Pydantic library to enforce expected formatting rules when outputting schema for final taxonomy ● Use bs4 for parsing HTML and JSON library to read in bookmark files and export files	**<u>Delete - (Cut it):</u>** ● Enhance information of nondescriptive bookmarks/bookmarks categorized as “Uncertain” by grabbing HTML of websites → summarizing topic/content of site (too much uncertainty in handling all the different website types e.g., videos, photos, forums, articles) ● Cross-platform compatibility ● Custom user preferences (e.g., predefined taxonomy and previous responses to follow-up questions) to be loaded the next time the program is launched ● Manage bookmarks across profiles and browsers, delegating which browser/profile stores what bookmarks
